Scan Report

September 25, 2025

Summary

This document reports on the results of an automatic security scan. All dates are displayed using the timezone "Coordinated Universal Time", which is abbreviated "UTC". The task was "metasploit 2". The scan started at Thu Sep 25 16:04:26 2025 UTC and ended at . The report first summarises the results found. Then, for each host, the report describes every issue found. Please consider the advice given in each description, in order to rectify the issue.

Contents

1 Result Overview

Host	High	Medium	Low	Log	False Positive
192.168.1.9	7	32	6	0	0
Total: 1	7	32	6	0	0

Vendor security updates are not trusted.
Overrides are off. Even when a result has an override, this report uses the actual threat of the result.
Information on overrides is included in the report.
Notes are included in the report.
This report might not show details of all issues that were found.
Issues with the threat level "Log" are not shown.
Issues with the threat level "Debug" are not shown.
Issues with the threat level "False Positive" are not shown.
Only results with a minimum QoD of 70 are shown.

This report contains all 45 results selected by the filtering described above. Before filtering there were 602 results.

2 Results per Host

2.1 192.168.1.9

Host scan start Thu Sep 25 16:05:08 2025 UTC
Host scan end

Service (Port)	Threat Level
513/tcp	High
512/tcp	High
6697/tcp	High
514/tcp	High
80/tcp	High
general/tcp	High
21/tcp	Medium
23/tcp	Medium
5432/tcp	Medium
25/tcp	Medium
2121/tcp	Medium
22/tcp	Medium
80/tcp	Medium
5900/tcp	Medium
general/icmp	Low
5432/tcp	Low

... (continues) ...

... (continued) ...

Service (Port)	Threat Level
25/tcp	Low
22/tcp	Low
general/tcp	Low

2.1.1 High 513/tcp

High (CVSS: 10.0)

NVT: rlogin Passwordless Login

Summary
The rlogin service allows root access without a password.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`It was possible to gain root access without a password.`

Impact
This vulnerability allows an attacker to gain complete control over the target system.

Solution:
Solution type: Mitigation
Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `rlogin Passwordless Login`
OID:1.3.6.1.4.1.25623.1.0.113766
Version used: `2020-09-30T09:30:12Z`

High (CVSS: 7.5)

NVT: The rlogin service is running

Summary
This remote host is running a rlogin service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

... continues on next page ...

... continued from previous page ...

The rlogin service is running on the target system.

Solution:
Solution type: Mitigation
Disable the rlogin service and use alternatives like SSH instead.

Vulnerability Insight
rlogin has several serious security problems,
- all information, including passwords, is transmitted unencrypted.
- .rlogin (or .rhosts) file is easy to misuse (potentially allowing anyone to login without a password)

Vulnerability Detection Method
Details: The rlogin service is running
OID:1.3.6.1.4.1.25623.1.0.901202
Version used: 2025-03-05T05:38:53Z

References
cve: CVE-1999-0651

[return to 192.168.1.9]

2.1.2 High 512/tcp

High (CVSS: 10.0)

NVT: The rexec service is running

Summary
This remote host is running a rexec service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The rexec service was detected on the target system.

Solution:
Solution type: Mitigation
Disable the rexec service and use alternatives like SSH instead.

Vulnerability Insight
rexec (remote execution client for an exec server) has the same kind of functionality that rsh has: you can execute shell commands on a remote computer.

... continues on next page ...

. . . continued from previous page . . .

The main difference is that rexec authenticate by reading the username and password *unencrypted* from the socket.

Vulnerability Detection Method
Checks whether an rexec service is exposed on the target host.
Details: `The rexec service is running`
OID:1.3.6.1.4.1.25623.1.0.100111
Version used: `2023-09-12T05:05:19Z`

References
`cve: CVE-1999-0618`

[return to 192.168.1.9]

2.1.3 High 6697/tcp

High (CVSS: 8.1)

NVT: UnrealIRCd Authentication Spoofing Vulnerability

Summary
UnrealIRCd is prone to authentication spoofing vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
Installed version: 3.2.8.1
Fixed version:     3.2.10.7
```

Impact
Successful exploitation of this vulnerability will allows remote attackers to spoof certificate fingerprints and consequently log in as another user.

Solution:
Solution type: VendorFix
Upgrade to UnrealIRCd 3.2.10.7, or 4.0.6, or later.

Affected Software/OS
UnrealIRCd before 3.2.10.7 and 4.x before 4.0.6.

Vulnerability Insight
The flaw exists due to an error in the 'm_authenticate' function in 'modules/m_sasl.c' script.

Vulnerability Detection Method

. . . continues on next page . . .

... continued from previous page ...

Checks if a vulnerable version is present on the target host.
Details: `UnrealIRCd Authentication Spoofing Vulnerability`
OID:1.3.6.1.4.1.25623.1.0.809883
Version used: `2023-07-14T16:09:27Z`

[return to 192.168.1.9]

2.1.4 High 514/tcp

High (CVSS: 7.5)

NVT: rsh Unencrypted Cleartext Login

Summary
This remote host is running a rsh service.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`The rsh service is misconfigured so it is allowing connections without a passwor`
`↪d or with default root:root credentials.`

Solution:
Solution type: Mitigation
Disable the rsh service and use alternatives like SSH instead.

Vulnerability Insight
rsh (remote shell) is a command line computer program which can execute shell commands as another user, and on another computer across a computer network.
Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

Vulnerability Detection Method
Details: `rsh Unencrypted Cleartext Login`

... continues on next page ...

... continued from previous page ...

OID:1.3.6.1.4.1.25623.1.0.100080
Version used: 2021-10-20T09:03:29Z

2.1.5 High 80/tcp

High (CVSS: 10.0)

NVT: TWiki XSS and Command Execution Vulnerabilities

Summary
TWiki is prone to Cross-Site Scripting (XSS) and Command Execution Vulnerabilities.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Installed version: 01.Feb.2003
Fixed version: 4.2.4

Impact
Successful exploitation could allow execution of arbitrary script code or commands. This could let attackers steal cookie-based authentication credentials or compromise the affected application.

Solution:
Solution type: VendorFix
Upgrade to version 4.2.4 or later.

Affected Software/OS
TWiki, TWiki version prior to 4.2.4.

Vulnerability Insight
The flaws are due to:
- %URLPARAM}}% variable is not properly sanitized which lets attackers conduct cross-site scripting attack.
- %SEARCH}}% variable is not properly sanitised before being used in an eval() call which lets the attackers execute perl code through eval injection attack.

Vulnerability Detection Method
Details: TWiki XSS and Command Execution Vulnerabilities
OID:1.3.6.1.4.1.25623.1.0.800320

... continues on next page ...

... continued from previous page ...

[return to 192.168.1.9]

2.1.6 High general/tcp

High (CVSS: 10.0)

NVT: Operating System (OS) End of Life (EOL) Detection

Summary
The Operating System (OS) on the remote host has reached the end of life (EOL) and should not be used anymore.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The "Ubuntu" Operating System on the remote host has reached the end of life.
CPE: cpe:/o:canonical:ubuntu_linux:8.04
Installed version,
build or SP: 8.04
EOL date: 2013-05-09
EOL info: https://wiki.ubuntu.com/Releases

Impact
An EOL version of an OS is not receiving any security updates from the vendor. Unfixed security vulnerabilities might be leveraged by an attacker to compromise the security of this host.

Solution:
Solution type: Mitigation
Update the OS on the remote host to a version which is still supported and receiving security updates by the vendor.
Note / Important: Please create an override for this result if the target host is a:
- Windows system with Extended Security Updates (ESU)
- System with additional 3rd-party / non-vendor security updates like e.g. from 'TuxCare', 'Freexian Extended LTS' or similar

... continues on next page ...

... continued from previous page ...

Vulnerability Detection Method
Checks if an EOL version of an OS is present on the target host.
Details: `Operating System (OS) End of Life (EOL) Detection`
OID:1.3.6.1.4.1.25623.1.0.103674
Version used: `2025-05-21T05:40:19Z`

[return to 192.168.1.9]

2.1.7 Medium 21/tcp

Medium (CVSS: 6.4)

NVT: Anonymous FTP Login Reporting

Summary
Reports if the remote FTP Server allows anonymous logins.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
It was possible to login to the remote FTP service with the following anonymous
↪account(s):
anonymous:anonymous@example.com
ftp:anonymous@example.com
```

Impact
Based on the files accessible via this anonymous FTP login and the permissions of this account an attacker might be able to:
- gain access to sensitive files
- upload or delete files.

Solution:
Solution type: Mitigation
If you do not want to share files, you should disable anonymous logins.

Vulnerability Insight
A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

... continues on next page ...

... continued from previous page ...

Remark: NIST don't see 'configuration issues' as software flaws so the referenced CVE has a severity of 0.0. The severity of this VT has been raised by Greenbone to still report a configuration issue on the target.

Vulnerability Detection Method
Details: `Anonymous FTP Login Reporting`
OID:1.3.6.1.4.1.25623.1.0.900600
Version used: `2021-10-20T09:03:29Z`

References
`cve: CVE-1999-0497`

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
↪. Response(s):
Non-anonymous sessions: 331 Please specify the password.
Anonymous sessions:     331 Please specify the password.
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation
Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528
Version used: `2023-12-20T05:05:58Z`

[return to 192.168.1.9]

2.1.8 Medium 23/tcp

Medium (CVSS: 4.8)

NVT: Telnet Unencrypted Cleartext Login

Summary
The remote host is running a Telnet service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact
An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

Solution:
Solution type: Mitigation
Replace Telnet with a protocol like SSH which supports encrypted connections.

Vulnerability Detection Method
Details: `Telnet Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108522
Version used: `2023-10-13T05:06:09Z`

[return to 192.168.1.9]

2.1.9 Medium 5432/tcp

Medium (CVSS: 5.9)

NVT: SSL/TLS: Report Weak Cipher Suites

Summary
This routine reports all weak SSL/TLS cipher suites accepted by a service.

Quality of Detection (QoD): 98%

Vulnerability Detection Result
```
'Weak' cipher suites accepted by this service via the SSLv3 protocol:
TLS_RSA_WITH_RC4_128_SHA
'Weak' cipher suites accepted by this service via the TLSv1.0 protocol:
```

... continues on next page ...

... continued from previous page ...

TLS_RSA_WITH_RC4_128_SHA

Impact
This could allow remote attackers to obtain sensitive information or have other, unspecified impacts.

Solution:
Solution type: Mitigation
The configuration of this services should be changed so that it does not accept the listed weak cipher suites anymore.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using weak SSL/TLS cipher suites.

Vulnerability Insight
These rules are applied for the evaluation of the cryptographic strength:
- RC4 is considered to be weak (CVE-2013-2566, CVE-2015-2808)
- Ciphers using 64 bit or less are considered to be vulnerable to brute force methods and therefore considered as weak (CVE-2015-4000)
- 1024 bit RSA authentication is considered to be insecure and therefore as weak
- Any cipher considered to be secure for only the next 10 years is considered as medium
- Any other cipher is considered as strong

Vulnerability Detection Method
Checks previous collected cipher suites.
NOTE: No severity for SMTP services with 'Opportunistic TLS' and weak cipher suites on port 25/tcp is reported. If too strong cipher suites are configured for this service the alternative would be to fall back to an even more insecure cleartext communication.
Details: SSL/TLS: Report Weak Cipher Suites
OID:1.3.6.1.4.1.25623.1.0.103440
Version used: 2025-03-27T05:38:50Z

Medium (CVSS: 5.9)

NVT: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Summary
It was possible to detect the usage of the deprecated SSLv2 and/or SSLv3 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result
In addition to TLSv1.0+ the service is also providing the deprecated SSLv3 protocol and supports one or more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.

Impact
An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight
The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method
Checks the used SSL protocols of the services provided by this system.
Details: SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection

Medium (CVSS: 5.3)

NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits

Summary

The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSL/TLS server is using the following certificate(s) with a RSA key w
```

... continues on next page ...

... continued from previous page ...

```
↪ith less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer):

↪omplication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
↪ch thing outside US,C=XX (Server certificate)
```

Impact
Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.

Solution:
Solution type: Mitigation
Replace the certificate with a stronger key and reissue the certificates it signed.

Vulnerability Insight
SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.

Vulnerability Detection Method
Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit.
Details: `SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048.`

```

Solution:
Solution type: Mitigation
Replace the SSL/TLS certificate by a new one.

Vulnerability Insight
This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.

Vulnerability Detection Method
Details: `SSL/TLS: Certificate Expired`
OID:1.3.6.1.4.1.25623.1.0.103955
Version used: `2024-06-14T05:05:48Z`

Medium (CVSS: 4.3)

NVT: SSL/TLS: Deprecated TLSv1.0 and TLSv1.1 Protocol Detection

Summary
It was possible to detect the usage of the deprecated TLSv1.0 and/or TLSv1.1 protocol on this system.

Quality of Detection (QoD): 98%

Vulnerability Detection Result

```
The service is only providing the deprecated TLSv1.0 protocol and supports one o
↪r more ciphers. Those supported ciphers can be found in the 'SSL/TLS: Report S
↪upported Cipher Suites' (OID: 1.3.6.1.4.1.25623.1.0.802067) VT.
```

Impact

... continues on next page ...

... continued from previous page ...

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated TLSv1.0 and/or TLSv1.1 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS
- All services providing an encrypted communication using the TLSv1.0 and/or TLSv1.1 protocols
- CVE-2023-41928: Kiloview P1 4G and P2 4G Video Encoder
- CVE-2024-41270: Gorush v1.18.4
- CVE-2025-3200: Multiple products from Wiesemann & Theis

Vulnerability Insight
The TLSv1.0 and TLSv1.1 protocols contain known cryptographic flaws like:
- CVE-2011-3389: Browser Exploit Against SSL/TLS (BEAST)
- CVE-2015-0204: Factoring Attack on RSA-EXPORT Keys Padding Oracle On Downgraded Legacy Encryption (FREAK)

Vulnerability Detection Method
Checks the used TLS protocols of the services provided by this system.

Medium (CVSS: 4.0)

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary
The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following certificates are part of the certificate chain but using insecure
↪signature algorithms:
Subject:              1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight
The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:
- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)

... continues on next page ...

. . . continued from previous page . . .

- Message Digest 4 (MD4)
- Message Digest 2 (MD2)
Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.
NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1, Fingerprint2

Vulnerability Detection Method
Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary
The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`Server Temporary Key Size: 1024 bits`

Impact
An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:
Solution type: Workaround
- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS

. . . continues on next page . . .

... continued from previous page ...

All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight
The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method
Checks the DHE temporary public key size.
Details: `SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.`

Vulnerability Detection Result

```
In addition to TLSv1.0+ the service is also providing the deprecated SSLv2 and S
↪SLv3 protocols and supports one or more ciphers. Those supported ciphers can b
↪e found in the 'SSL/TLS: Report Supported Cipher Suites' (OID: 1.3.6.1.4.1.256
↪23.1.0.802067) VT.
```

Impact

An attacker might be able to use the known cryptographic flaws to eavesdrop the connection between clients and the service to get access to sensitive data transferred within the secured connection.
Furthermore newly uncovered vulnerabilities in this protocols won't receive security updates anymore.

Solution:
Solution type: Mitigation
It is recommended to disable the deprecated SSLv2 and/or SSLv3 protocols in favor of the TLSv1.2+ protocols.
Please see the references for more resources supporting you with this task.

Affected Software/OS

All services providing an encrypted communication using the SSLv2 and/or SSLv3 protocols.

Vulnerability Insight

The SSLv2 and SSLv3 protocols contain known cryptographic flaws like:
- CVE-2014-3566: Padding Oracle On Downgraded Legacy Encryption (POODLE)
- CVE-2016-0800: Decrypting RSA with Obsolete and Weakened eNcryption (DROWN)

Vulnerability Detection Method

Checks the used SSL protocols of the services provided by this system.
Details: `SSL/TLS: Deprecated SSLv2 and SSLv3 Protocol Detection`

Medium (CVSS: 5.3)

NVT: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048 bits

Summary
The remote SSL/TLS server certificate and/or any of the certificates in the certificate chain is using a RSA key with less than 2048 bits.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSL/TLS server is using the following certificate(s) with a RSA key w
↪ith less than 2048 bits (public-key-size:public-key-algorithm:serial:issuer):
1024:RSA:00FAF93A4C7FB6B9CC:1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D
↪626173652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for C
↪omplication of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no su
↪ch thing outside US,C=XX (Server certificate)
```

Impact
Using certificates with weak RSA key size can lead to unauthorized exposure of sensitive information.

Solution:
Solution type: Mitigation
Replace the certificate with a stronger key and reissue the certificates it signed.

... continues on next page ...

... continued from previous page ...

Vulnerability Insight
SSL/TLS certificates using RSA keys with less than 2048 bits are considered unsafe.

Vulnerability Detection Method
Checks the RSA keys size of the server certificate and all certificates in chain for a size < 2048 bit.
Details: SSL/TLS: Server Certificate / Certificate in Chain with RSA keys less than 2048.

Solution:
Solution type: Mitigation
Replace the SSL/TLS certificate by a new one.

Vulnerability Insight
This script checks expiry dates of certificates associated with SSL/TLS-enabled services on the target and reports whether any have already expired.

Vulnerability Detection Method
Details: SSL/TLS: Certificate Expired
OID:1.3.6.1.4.1.25623.1.0.103955
Version used: 2024-06-14T05:05:48Z

Medium (CVSS: 5.0)

NVT: Check if Mailserver answer to VRFY and EXPN requests

Summary
The Mailserver on this host answers to VRFY and/or EXPN requests.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
'VRFY root' produces the following answer: 252 2.0.0 root

Solution:
Solution type: Workaround
Disable VRFY and/or EXPN on your Mailserver.
For postfix add 'disable_vrfy_command=yes' in 'main.cf'.
For Sendmail add the option 'O PrivacyOptions=goaway'.
It is suggested that, if you really want to publish this type of information, you use a mechanism that legitimate users actually know about, such as Finger or HTTP.

Vulnerability Insight
VRFY and EXPN ask the server for information about an address. They are inherently unusable through firewalls, gateways, mail exchangers for part-time hosts, etc.

Vulnerability Detection Method
Details: Check if Mailserver answer to VRFY and EXPN requests
OID:1.3.6.1.4.1.25623.1.0.100072
Version used: 2023-10-31T05:06:37Z

url: http://cr.yp.to/smtp/vrfy.html

Medium (CVSS: 4.3)

NVT: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

Summary
This host is accepting 'RSA_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
'RSA_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5
'RSA_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_RSA_EXPORT_WITH_RC2_CBC_40_MD5
TLS_RSA_EXPORT_WITH_RC4_40_MD5

Impact
Successful exploitation will allow remote attacker to downgrade the security of a session to use 'RSA_EXPORT' cipher suites, which are significantly weaker than non-export cipher suites. This may allow a man-in-the-middle attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:
Solution type: VendorFix
- Remove support for 'RSA_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task.
- If the service is using OpenSSL: Update to version 0.9.8zd, 1.0.0p, 1.0.1k or later.

Affected Software/OS
- Hosts accepting 'RSA_EXPORT' cipher suites.
- OpenSSL versions prior to 0.9.8zd, 1.0.0 prior to 1.0.0p and 1.0.1 prior to 1.0.1k.

Vulnerability Insight
Flaw is due to improper handling RSA temporary keys in a non-export RSA key exchange cipher suite.

... continues on next page ...

... continued from previous page ...

Vulnerability Detection Method

Checks previous collected cipher suites.

Details: SSL/TLS: RSA Temporary Key Handling 'RSA_EXPORT' Downgrade Issue (FREAK)

dfn-cert: DFN-CERT-2011-1482

Medium (CVSS: 4.0)

NVT: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerability

Summary
The SSL/TLS service uses Diffie-Hellman groups with insufficient strength (key size < 2048).

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Server Temporary Key Size: 1024 bits

Impact
An attacker might be able to decrypt the SSL/TLS communication offline.

Solution:
Solution type: Workaround
- Deploy (Ephemeral) Elliptic-Curve Diffie-Hellman (ECDHE) or use a 2048-bit or stronger Diffie-Hellman group. Please see the references for more resources supporting you with this task.
- For Apache Web Servers: Beginning with version 2.4.7, mod_ssl will use DH parameters which include primes with lengths of more than 1024 bits.

Affected Software/OS
All services providing an encrypted communication using Diffie-Hellman groups with insufficient strength.

Vulnerability Insight
The Diffie-Hellman group are some big numbers that are used as base for the DH computations. They can be, and often are, fixed. The security of the final secret depends on the size of these parameters. It was found that 512 and 768 bits to be weak, 1024 bits to be breakable by really powerful attackers like governments.

Vulnerability Detection Method
Checks the DHE temporary public key size.
Details: SSL/TLS: Diffie-Hellman Key Exchange Insufficient DH Group Strength Vulnerabili.

Medium (CVSS: 4.0)

NVT: SSL/TLS: Certificate Signed Using A Weak Signature Algorithm

Summary
The remote service is using a SSL/TLS certificate in the certificate chain that has been signed using a cryptographically weak hashing algorithm.

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The following certificates are part of the certificate chain but using insecure
↪signature algorithms:
Subject:              1.2.840.113549.1.9.1=#726F6F74407562756E74753830342D626173
↪652E6C6F63616C646F6D61696E,CN=ubuntu804-base.localdomain,OU=Office for Complic
↪ation of Otherwise Simple Affairs,O=OCOSA,L=Everywhere,ST=There is no such thi
↪ng outside US,C=XX
Signature Algorithm:  sha1WithRSAEncryption
```

Solution:
Solution type: Mitigation
Servers that use SSL/TLS certificates signed with a weak SHA-1, MD5, MD4 or MD2 hashing algorithm will need to obtain new SHA-2 signed SSL/TLS certificates to avoid web browser SSL/TLS certificate warnings.

Vulnerability Insight
The following hashing algorithms used for signing SSL/TLS certificates are considered cryptographically weak and not secure enough for ongoing use:
- Secure Hash Algorithm 1 (SHA-1)
- Message Digest 5 (MD5)
- Message Digest 4 (MD4)
- Message Digest 2 (MD2)

... continues on next page ...

... continued from previous page ...

Beginning as late as January 2017 and as early as June 2016, browser developers such as Microsoft and Google will begin warning users when visiting web sites that use SHA-1 signed Secure Socket Layer (SSL) certificates.
NOTE: The script preference allows to set one or more custom SHA-1 fingerprints of CA certificates which are trusted by this routine. The fingerprints needs to be passed comma-separated and case-insensitive:
Fingerprint1
or
fingerprint1, Fingerprint2

Vulnerability Detection Method
Check which hashing algorithm was used to sign the remote SSL/TLS certificate.
Details: `SSL/TLS: Certificate Signed Using A Weak Signature Algorithm`

[return to 192.168.1.9]

2.1.11 Medium 2121/tcp

Medium (CVSS: 4.8)

NVT: FTP Unencrypted Cleartext Login

Summary
The remote host is running a FTP service that allows cleartext logins over unencrypted connections.

Quality of Detection (QoD): 70%

Vulnerability Detection Result
```
The remote FTP service accepts logins without a previous sent 'AUTH TLS' command
. Response(s):
Non-anonymous sessions: 331 Password required for openvasvt
Anonymous sessions:     331 Password required for anonymous
```

Impact
An attacker can uncover login names and passwords by sniffing traffic to the FTP service.

Solution:
Solution type: Mitigation

... continues on next page ...

... continued from previous page ...

Enable FTPS or enforce the connection via the 'AUTH TLS' command. Please see the manual of the FTP service for more information.

Vulnerability Detection Method
Tries to login to a non FTPS enabled FTP service without sending a 'AUTH TLS' command first and checks if the service is accepting the login without enforcing the use of the 'AUTH TLS' command.
Details: `FTP Unencrypted Cleartext Login`
OID:1.3.6.1.4.1.25623.1.0.108528
Version used: `2023-12-20T05:05:58Z`

[return to 192.168.1.9]

2.1.12 Medium 22/tcp

Medium (CVSS: 5.3)

NVT: Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak KEX algorithm(s):
KEX algorithm                      | Reason
-----------------------------------------------------------------------------
↪-----------
diffie-hellman-group-exchange-sha1 | Using SHA-1
diffie-hellman-group1-sha1         | Using Oakley Group 2 (a 1024-bit MODP group
↪) and SHA-1
```

Impact
An attacker can quickly break individual connections.

Solution:
Solution type: Mitigation
Disable the reported weak KEX algorithm(s)
- 1024-bit MODP group / prime KEX algorithms:
Alternatively use elliptic-curve Diffie-Hellmann in general, e.g. Curve 25519.

Vulnerability Insight

... continues on next page ...

... continued from previous page ...

- 1024-bit MODP group / prime KEX algorithms:
Millions of HTTPS, SSH, and VPN servers all use the same prime numbers for Diffie-Hellman key exchange. Practitioners believed this was safe as long as new key exchange messages were generated for every connection. However, the first step in the number field sieve-the most efficient algorithm for breaking a Diffie-Hellman connection-is dependent only on this prime.
A nation-state can break a 1024-bit prime.

Vulnerability Detection Method
Checks the supported KEX algorithms of the remote SSH server.
Currently weak KEX algorithms are defined as the following:
- non-elliptic-curve Diffie-Hellmann (DH) KEX algorithms with 1024-bit MODP group / prime
- ephemerally generated key exchange groups uses SHA-1
- using RSA 1024-bit modulus key
Details: `Weak Key Exchange (KEX) Algorithm(s) Supported (SSH)`

aes256-cbc
arcfour
arcfour128
arcfour256
blowfish-cbc
cast128-cbc
```

... continues on next page ...

... continued from previous page ...

rijndael-cbc@lysator.liu.se

Solution:
Solution type: Mitigation
Disable the reported weak encryption algorithm(s).

Vulnerability Insight
- The 'arcfour' cipher is the Arcfour stream cipher with 128-bit keys. The Arcfour cipher is believed to be compatible with the RC4 cipher [SCHNEIER]. Arcfour (and RC4) has problems with weak keys, and should not be used anymore.
- The 'none' algorithm specifies that no encryption is to be done. Note that this method provides no confidentiality protection, and it is NOT RECOMMENDED to use it.
- A vulnerability exists in SSH messages that employ CBC mode that may allow an attacker to recover plaintext from a block of ciphertext.

Vulnerability Detection Method
Checks the supported encryption algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak encryption algorithms are defined as the following:
- Arcfour (RC4) cipher based algorithms
- 'none' algorithm
- CBC mode cipher based algorithms
Details: Weak Encryption Algorithm(s) Supported (SSH)

2.1.13 Medium 80/tcp

Medium (CVSS: 6.8)

NVT: TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)

Summary
TWiki is prone to a cross-site request forgery (CSRF) vulnerability.

Quality of Detection (QoD): 80%

... continues on next page ...

... continued from previous page ...

Vulnerability Detection Result
Installed version: 01.Feb.2003
Fixed version: 4.3.2

Impact
Successful exploitation will allow attacker to gain administrative privileges on the target application and can cause CSRF attack.

Solution:
Solution type: VendorFix
Upgrade to TWiki version 4.3.2 or later.

Affected Software/OS
TWiki version prior to 4.3.2

Vulnerability Insight
Attack can be done by tricking an authenticated TWiki user into visiting a static HTML page on another side, where a Javascript enabled browser will send an HTTP POST request to TWiki, which in turn will process the request as the TWiki user.

Vulnerability Detection Method
Details: TWiki Cross-Site Request Forgery Vulnerability (Sep 2010)
OID:1.3.6.1.4.1.25623.1.0.801281
Version used: 2024-03-01T14:37:10Z

Medium (CVSS: 6.1)

NVT: jQuery < 1.9.0 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Installed version: 1.3.2
Fixed version: 1.9.0
Installation

... continues on next page ...

... continued from previous page ...

```
path / port:       /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.1.9/mutillidae/javascript/ddsmoothmenu/jquery.
↪min.js
- Referenced at:   http://192.168.1.9/mutillidae/
```

Solution:
Solution type: VendorFix
Update to version 1.9.0 or later.

Affected Software/OS
jQuery prior to version 1.9.0.

Vulnerability Insight
The jQuery(strInput) function does not differentiate selectors from HTML in a reliable fashion. In vulnerable versions, jQuery determined whether the input was HTML by looking for the '<' character anywhere in the string, giving attackers more flexibility when attempting to construct a malicious payload. In fixed versions, jQuery only deems the input to be HTML if it explicitly starts with the '<' character, limiting exploitability only to attackers who can control the beginning of a string, which is far less common.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: `jQuery < 1.9.0 XSS Vulnerability`

NVT: HTTP Debugging Methods (TRACE/TRACK) Enabled

Summary
The remote web server supports the TRACE and/or TRACK methods. TRACE and TRACK are HTTP methods which are used to debug web server connections.

Quality of Detection (QoD): 99%

Vulnerability Detection Result
`The web server has the following HTTP methods enabled: TRACE`

Impact
An attacker may use this flaw to trick your legitimate web users to give him their credentials.

Solution:
Solution type: Mitigation
Disable the TRACE and TRACK methods in your web server configuration.
Please see the manual of your web server or the references for more information.

Affected Software/OS

. . . continues on next page . . .

... continued from previous page ...

Web servers with enabled TRACE and/or TRACK methods.

Vulnerability Insight
It has been shown that web servers supporting this methods are subject to cross-site-scripting attacks, dubbed XST for Cross-Site-Tracing, when used in conjunction with various weaknesses in browsers.

Vulnerability Detection Method
Checks if HTTP methods such as TRACE and TRACK are enabled and can be used.
Details: `HTTP Debugging Methods (TRACE/TRACK) Enabled`

  <title>phpinfo()</title><meta name="ROBOTS" content="NOINDEX,NOFOLLOW,NOARCHIV
↪E" /></head>
  <tr><td class="e">Configuration File (php.ini) Path </td><td class="v">/etc/ph
↪p5/cgi </td></tr>
  <h2>PHP Variables</h2>
```

Impact
Some of the information that can be gathered from this file includes:
The username of the user running the PHP process, if it is a sudo user, the IP address of the host, the web server version, the system version (Unix, Linux, Windows, ...), and the root directory of the web server.

Solution:
Solution type: Workaround
Delete the listed files or restrict access to them.

Affected Software/OS
All systems exposing a file containing the output of the phpinfo() PHP function.
This VT is also reporting if an affected endpoint for the following products have been identified:
- CVE-2008-0149: TUTOS
- CVE-2023-49282, CVE-2023-49283: Microsoft Graph PHP SDK
- CVE-2024-10486: Google for WooCommerce plugin for WordPress

Vulnerability Insight

... continues on next page ...

... continued from previous page ...

Many PHP installation tutorials instruct the user to create a file called phpinfo.php or similar containing the phpinfo() statement. Such a file is often left back in the webserver directory.

Vulnerability Detection Method
This script reports files identified by the following separate VT: 'phpinfo() Output Detection (HTTP)' (OID: 1.3.6.1.4.1.25623.1.0.108474).
Details: `phpinfo() Output Reporting (HTTP)`
OID:1.3.6.1.4.1.25623.1.0.11229
Version used: `2025-07-09T05:43:50Z`

References
`cve: CVE-2008-0149`
`cve: CVE-2023-49282`
`cve: CVE-2023-49283`
`cve: CVE-2024-10486`
`url: https://www.php.net/manual/en/function.phpinfo.php`
`url: https://beaglesecurity.com/blog/vulnerability/revealing-phpinfo.html`

Medium (CVSS: 5.0)

NVT: /doc directory browsable

Summary
The /doc directory is browsable. /doc shows the content of the /usr/doc directory and therefore it shows which programs and - important! - the version of the installed programs.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`Vulnerable URL: http://192.168.1.9/doc/`

Solution:
Solution type: Mitigation
Use access restrictions for the /doc directory. If you use Apache you might use this in your access.conf:
<Directory /usr/doc> AllowOverride None order deny, allow deny from all allow from localhost </Directory>

Vulnerability Detection Method
Details: `/doc directory browsable`
OID:1.3.6.1.4.1.25623.1.0.10056
Version used: `2023-08-01T13:29:10Z`

References
`cve: CVE-1999-0678`

... continued from previous page ...

url: http://www.securityfocus.com/bid/318

Medium (CVSS: 4.8)

NVT: Cleartext Transmission of Sensitive Information via HTTP

Summary
The host / application transmits sensitive information (username, passwords) in cleartext via HTTP.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
The following input fields were identified (URL:input name):
http://192.168.1.9/dvwa/login.php:password
http://192.168.1.9/phpMyAdmin/:pma_password
http://192.168.1.9/phpMyAdmin/?D=A:pma_password
http://192.168.1.9/tikiwiki/tiki-install.php:pass
http://192.168.1.9/twiki/bin/view/TWiki/TWikiUserAuthentication:oldpassword

Impact
An attacker could use this situation to compromise or eavesdrop on the HTTP communication between the client and the server using a man-in-the-middle attack to get access to sensitive data like usernames or passwords.

Solution:
Solution type: Workaround
Enforce the transmission of sensitive data via an encrypted SSL/TLS connection. Additionally make sure the host / application is redirecting all users to the secured SSL/TLS connection before allowing to input sensitive data into the mentioned functions.

Affected Software/OS
Hosts / applications which doesn't enforce the transmission of sensitive data via an encrypted SSL/TLS connection.

Vulnerability Detection Method
Evaluate previous collected information and check if the host / application is not enforcing the transmission of sensitive data via an encrypted SSL/TLS connection.
The script is currently checking the following:
- HTTP Basic Authentication (Basic Auth)
- HTTP Forms (e.g. Login) with input field of type 'password'
Details: Cleartext Transmission of Sensitive Information via HTTP
OID:1.3.6.1.4.1.25623.1.0.108440
Version used: 2023-09-07T05:05:21Z

Medium (CVSS: 4.3)

NVT: jQuery < 1.6.3 XSS Vulnerability

Summary
jQuery is prone to a cross-site scripting (XSS) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Installed version: 1.3.2
Fixed version: 1.6.3
Installation
path / port: /mutillidae/javascript/ddsmoothmenu/jquery.min.js
Detection info (see OID: 1.3.6.1.4.1.25623.1.0.150658 for more info):
- Identified file: http://192.168.1.9/mutillidae/javascript/ddsmoothmenu/jquery.
↪min.js
- Referenced at: http://192.168.1.9/mutillidae/

Solution:
Solution type: VendorFix
Update to version 1.6.3 or later.

Affected Software/OS
jQuery prior to version 1.6.3.

Vulnerability Insight
Cross-site scripting (XSS) vulnerability in jQuery before 1.6.3, when using location.hash to select elements, allows remote attackers to inject arbitrary web script or HTML via a crafted tag.

Vulnerability Detection Method
Checks if a vulnerable version is present on the target host.
Details: jQuery < 1.6.3 XSS Vulnerability
OID:1.3.6.1.4.1.25623.1.0.141637
Version used: 2023-07-14T05:06:08Z

[return to 192.168.1.9]

2.1.14 Medium 5900/tcp

Medium (CVSS: 4.8)

NVT: VNC Server Unencrypted Data Transmission

Summary
The remote host is running a VNC server providing one or more insecure or cryptographically weak Security Type(s) not intended for use on untrusted networks.

Quality of Detection (QoD): 70%

Vulnerability Detection Result

```
The VNC server provides the following insecure or cryptographically weak Securit
↪y Type(s):
2 (VNC authentication)
```

Impact
An attacker can uncover sensitive data by sniffing traffic to the VNC server.

Solution:
Solution type: Mitigation
Run the session over an encrypted channel provided by IPsec [RFC4301] or SSH [RFC4254]. Some VNC server vendors are also providing more secure Security Types within their products.

Vulnerability Detection Method
Details: `VNC Server Unencrypted Data Transmission`
OID:1.3.6.1.4.1.25623.1.0.108529
Version used: `2023-07-12T05:05:04Z`

[return to 192.168.1.9]

2.1.15 Low general/icmp

Low (CVSS: 2.1)

NVT: ICMP Timestamp Reply Information Disclosure

Summary
The remote host responded to an ICMP timestamp request.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
`The following response / ICMP packet has been received:`
`- ICMP Type: 14`
`- ICMP Code: 0`

Impact
This information could theoretically be used to exploit weak time-based random number generators in other services.

Solution:
Solution type: Mitigation
Various mitigations are possible:
- Disable the support for ICMP timestamp on the remote host completely
- Protect the remote host by a firewall, and block ICMP packets passing through the firewall in either direction (either completely or only for untrusted networks)

Vulnerability Insight
The Timestamp Reply is an ICMP message which replies to a Timestamp message. It consists of the originating timestamp sent by the sender of the Timestamp as well as a receive timestamp and a transmit timestamp.

Vulnerability Detection Method
Sends an ICMP Timestamp (Type 13) request and checks if a Timestamp Reply (Type 14) is received.
Details: `ICMP Timestamp Reply Information Disclosure`
OID:1.3.6.1.4.1.25623.1.0.103190

[return to 192.168.1.9]

2.1.17 Low 25/tcp

Low (CVSS: 3.7)

NVT: SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)

Summary
This host is accepting 'DHE_EXPORT' cipher suites and is prone to a man-in-the-middle (MITM) vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
'DHE_EXPORT' cipher suites accepted by this service via the SSLv3 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA

... continues on next page ...

... continued from previous page ...

```
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
'DHE_EXPORT' cipher suites accepted by this service via the TLSv1.0 protocol:
TLS_DHE_RSA_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_DES40_CBC_SHA
TLS_DH_anon_EXPORT_WITH_RC4_40_MD5
```

Impact
Successful exploitation will allow a man-in-the-middle attacker to downgrade the security of a TLS session to 512-bit export-grade cryptography, which is significantly weaker, allowing the attacker to more easily break the encryption and monitor or tamper with the encrypted stream.

Solution:
Solution type: VendorFix
- Remove support for 'DHE_EXPORT' cipher suites from the service. Please see the references for more resources supporting you with this task.
- If the service is using OpenSSL: Update to version 1.0.1n, 1.0.2b or later.

Affected Software/OS
- Hosts accepting 'DHE_EXPORT' cipher suites.
- OpenSSL versions prior to 1.0.1n and 1.0.2 prior to 1.0.2b.

Vulnerability Insight
Flaw is triggered when handling Diffie-Hellman key exchanges defined in the 'DHE_EXPORT' cipher suites.

Vulnerability Detection Method
Checks previous collected cipher suites.
Details: `SSL/TLS: 'DHE_EXPORT' MITM Security Bypass Vulnerability (LogJam)`

Low (CVSS: 3.4)

NVT: SSL/TLS: SSLv3 Protocol CBC Cipher Suites Information Disclosure Vulnerability (POODLE)

Summary
This host is prone to an information disclosure vulnerability.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
Vulnerability was detected according to the Vulnerability Detection Method.

Impact

... continues on next page ...

... continued from previous page ...

Successful exploitation will allow a man-in-the-middle attackers gain access to the plain text data stream.

Solution:
Solution type: Mitigation
Possible Mitigations are:
- Disable SSLv3
- Disable cipher suites supporting CBC cipher modes
- Enable TLS_FALLBACK_SCSV if the service is providing TLSv1.0+

Vulnerability Insight
The flaw is due to the block cipher padding not being deterministic and not covered by the Message Authentication Code

Vulnerability Detection Method
Evaluate previous collected information about this service.

[return to 192.168.1.9]

2.1.18 Low 22/tcp

Low (CVSS: 2.6)

NVT: Weak MAC Algorithm(s) Supported (SSH)

Summary
The remote SSH server is configured to allow / support weak MAC algorithm(s).

Quality of Detection (QoD): 80%

Vulnerability Detection Result

```
The remote SSH server supports the following weak client-to-server MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
umac-64@openssh.com
The remote SSH server supports the following weak server-to-client MAC algorithm
↪(s):
hmac-md5
hmac-md5-96
hmac-sha1-96
umac-64@openssh.com
```

Solution:
Solution type: Mitigation
Disable the reported weak MAC algorithm(s).

Vulnerability Detection Method

... continues on next page ...

... continued from previous page ...

Checks the supported MAC algorithms (client-to-server and server-to-client) of the remote SSH server.
Currently weak MAC algorithms are defined as the following:
- MD5 based algorithms
- 96-bit based algorithms
- 64-bit based algorithms
- 'none' algorithm
Details: `Weak MAC Algorithm(s) Supported (SSH)`
OID:1.3.6.1.4.1.25623.1.0.105610
Version used: `2024-06-14T05:05:48Z`

[return to 192.168.1.9]

2.1.19 Low general/tcp

Low (CVSS: 2.6)

NVT: TCP Timestamps Information Disclosure

Summary
The remote host implements TCP timestamps and therefore allows to compute the uptime.

Quality of Detection (QoD): 80%

Vulnerability Detection Result
```
It was detected that the host implements RFC1323/RFC7323.
The following timestamps were retrieved with a delay of 1 seconds in-between:
Packet 1: 65719
Packet 2: 65827
```

Impact
A side effect of this feature is that the uptime of the remote host can sometimes be computed.

Solution:
Solution type: Mitigation
To disable TCP timestamps on linux add the line 'net.ipv4.tcp_timestamps = 0' to /etc/sysctl.conf. Execute 'sysctl -p' to apply the settings at runtime.
To disable TCP timestamps on Windows execute 'netsh int tcp set global timestamps=disabled'
Starting with Windows Server 2008 and Vista, the timestamp can not be completely disabled.

... continues on next page ...

... continued from previous page ...

The default behavior of the TCP/IP stack on this Systems is to not use the Timestamp options when initiating TCP connections, but use them if the TCP peer that is initiating communication includes them in their synchronize (SYN) segment.
See the references for more information.

Affected Software/OS
TCP implementations that implement RFC1323/RFC7323.

Vulnerability Insight
The remote host implements TCP timestamps, as defined by RFC1323/RFC7323.

Vulnerability Detection Method
Special IP packets are forged and sent with a little delay in between to the target IP. The responses are searched for a timestamps. If found, the timestamps are reported.
Details: `TCP Timestamps Information Disclosure`
